

What kind of arrowhead will you design?

Types of Arrowheads

The lanceolate arrowheads include:

Auriculate: An auriculate arrowhead is a fish-shaped arrowhead that includes auricles or ears which point downward at an angle.

Lanceolate: With a straight or concave base, a lanceolate arrowhead has a blade that expands out from the tip, narrowing back in near the base.

Leaf: The leaf arrowhead is also called an egg-shaped or ovate arrowhead, and it has a point that expands out from the tip and then narrows back in at the base. It also has a round, not straight, base.

Triangle: In a triangle arrowhead, the blade extends out from the base to the tip.

Notched arrowheads include the following:

Basal Notched: Because these arrowheads have notches that enter the body from the base of the point, they tend to have very long barbs.

Corner Notched: Usually resulting in the creation of a barb, these arrowheads have notches that enter the body of the point from the corner. They can also enter where the blade and the base meet.

Side Notched: In these arrowheads, parallel notches are created because the notches enter from the blade to the body of the point.
